# 1.Introduction

BookShare is a social media platform designed specifically for readers and book lovers. The system combines the idea of social interaction inspired by Instagram with reading-related activities such as sharing book quotes, reviews, reading progress, and favorite books.

The application provides users with an engaging visual experience where they can connect with other readers, discover books, participate in reading challenges, and build interactive reading profiles. The project focuses on creating a modern and user-friendly interface using React and integrating backend services such as Supabase for authentication and data storage.

## 2.Problem Statement

Current reading platforms mainly focus on tracking books or writing long reviews. Most of these platforms lack a modern and visually engaging environment where users can quickly share their reading experiences in the form of quotes, book covers, short reviews, and reading progress updates.

Readers need a social platform that allows them to express their reading journey in the same simple and interactive way other social networking platforms such as Instagram allows users to share daily moments.

## 3.Solution Statement

BookShare solves this problem by creating a social networking platform dedicated to readers. The platform allows users to:

- Share quotes, reviews, reading progress and thoughts

- Interact with posts through likes, comments, and saves.
- Discover trending books, authors, and genres.
- Build personalized reading profiles.
- Participate in reading challenges and track progress.

## 4. Technology used:

The system uses:

- React TypeScript for building responsive user interfaces
- Supabase for authentication, database management

## 5. System Analysis

### Stakeholders

- Readers and book lovers
- Registered users

### User Requirements

- Easy registration and login
- Ability to create and edit posts
- Search for books and authors
- Personalized profiles
- Responsive and visually appealing design
- Reading progress tracking

## 6. Functional Requirements

### User Management

- User registration
- User login/logout
- Password authentication

### Post Management

- Create posts
- Share reading progress

### Social Interaction

- Like posts
- Comment on posts
- Save favorite posts
- Follow users

### Discover Features

- Search books and authors
- Explore trending content
- View recommendations

### User Profiles

- Display reading statistics
- Show user bio
- Display user posts in grid layout

### Reading Challenges

- Create challenges
- Track reading progress
- Update challenge completion

## 7. Non-Functional Requirements

### Performance

- Fast loading pages
- Smooth navigation between screens

### Security

- Secure authentication
- Protected user data

### Usability

- User-friendly interface
- Responsive design for mobile and desktop

### Scalability

- Ability to support increasing numbers of users and posts

## 8. Use Case Scenarios

### Use Case 1: Create a Reading Post

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| <b>Actor</b>         | <b>Registered User</b>                                                      |
| <b>Preconditions</b> | <ul style="list-style-type: none"> <li>• User must be logged in.</li> </ul> |

|                       |                                                                                                                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Main Flow</b>      | <ol style="list-style-type: none"> <li>1. User clicks on “Create Post”.</li> <li>2. User selects post type (quote, review, reading progress or thought).</li> <li>3. User enters content and uploads book image.</li> <li>4. User clicks “post”.</li> <li>5. System stores and displays the post in the feed.</li> </ol> |
| <b>Postconditions</b> | <ul style="list-style-type: none"> <li>• Post becomes visible to other users.</li> </ul>                                                                                                                                                                                                                                 |

## Use Case 2: Search for a Book

|                      |                                                                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Actor</b>         | <b>Registered User</b>                                                                                                                                                        |
| <b>Preconditions</b> | <ul style="list-style-type: none"> <li>• User must be logged in.</li> <li>• Posts must already exist in the feed.</li> </ul>                                                  |
| <b>Main Flow</b>     | <ol style="list-style-type: none"> <li>1. User opens the Feed page.</li> <li>2. User browses available posts.</li> <li>3. User clicks the “Like” button on a post.</li> </ol> |

|                       |                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <p>4. System updates the like count instantly.</p> <p>5. User writes a comment on the post.</p>                                                                              |
| <b>Postconditions</b> | <ul style="list-style-type: none"> <li>• The post interaction is saved successfully.</li> <li>• Other users can view the updated likes and comments in real time.</li> </ul> |

## 9. Conclusion

BookShare provides a modern and interactive reading community platform where readers can share their experiences visually and socially. The system combines social media interaction with reading activities to create an engaging environment for book lovers. By using modern web technologies and backend services, the application ensures scalability, usability, and smooth performance for users.
